

# SASI

## *The Simple Automated Services Interface for the Granite Inventory system.*

Companies that use Telcordia Technologies' Granite Inventory system have long realized the importance of maintaining the quality of their data. Despite that, manually entering changes into the database can be prone to errors and takes a lot of time and money. The cost and difficulty of maintaining the system often leads to picking and choosing which parts of your network you track in Granite. This means you don't get the full benefit of your Granite system.

Now you don't have to compromise when it comes to taking advantage of your Granite database. SASI allows you to fully leverage your Granite system by allowing you to maintain your data faster, cheaper and with much less effort.

SASI is the new Simple Automated Services Interface platform developed by Sincera. As the diagram below shows, SASI is built on top of the Advanced Services Interface (ASI) provided by Telcordia, just like the standard Granite client. SASI takes the system calls provided by the ASI and adds our own functionality to them, creating new capabilities for working with your Granite data.

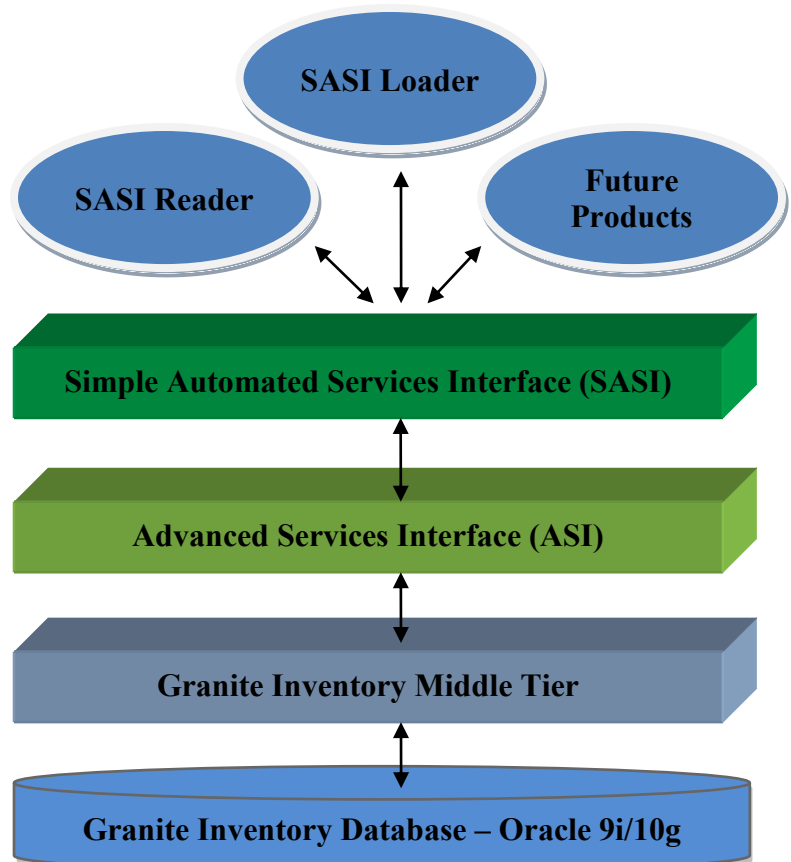

At its core, SASI is a platform that allows for the creation of very specialized clients for the Granite database. Because we use the ASI instead of direct table access, you simply can't break your database using a SASI-based solution. Using SASI tools, you can perform operations that aren't available any other way, including:

- Add large numbers of new records to your system without direct table access to your database.
- Bulk update existing records with new data for each record (not one value for all records).
- Modify any Granite object, including Paths, Networks and User Defined Attributes using simple delimited text files.
- Extract records based on OR values (this site OR that site, this shelf OR that shelf) using a single SASI query.

SASI tools are like the perfect employee: they're fast, they're inexpensive, they don't make mistakes and they don't take breaks. Start improving your data and your ROI today, with SASI!
