

*Automated loading, updating and deleting for
the Granite inventory system.*

SASI Loader from Sincera that enables Granite customers to load, update or delete large numbers of Granite Inventory records faster, cheaper and with more accuracy than ever before. SASI Loader is built using the Simple Automated Services Interface, a platform developed by Sincera that enables us to create effective solutions for Granite Inventory customers.

Like all SASI-based solutions, SASI Loader appears as a Granite client to your system. This means that SASI Loader isn't required to be installed on your servers, doesn't need direct access to your database schema, and requires no special permissions on your system. A user with SASI Loader has all the same permissions and access that they would have using a standard Granite client - no more, no less.

SASI Loader can be run either using our GUI, or from the command line. Our GUI is simple, easy to learn and straightforward, but puts the full power of SASI Loader at your command. Command line operations are ideal for scheduling runs to be executed during maintenance windows at night, or for scripting operations. You can install SASI Loader on a server, or on a desktop or notebook computer. Installation takes minutes, and with a connection to your network SASI Loader can begin delivering measurable ROI immediately.

When working with SASI Loader, you can be assured that your Granite Inventory system is safe from data structure errors or improper operations. That's because Sincera's SASI platform uses the Advanced Services Interface (ASI) provided by Telcordia Technologies for working with the Granite database. Unlike solutions that require direct table access to your database, SASI-based tools work with the ASI to ensure that all operations are handled properly. And because SASI uses the ASI, both the inherent Granite business logic and all of your organization's business rules are fully respected by SASI Loader.

SASI Loader is ideal for Granite end user tasks that are large and repetitive in nature, such as:

- Switch decommissions.
- New site builds.
- Path re-homes.
- BSC load balancing.
- Modeling/object naming standardization.
- Billing system reconciliation.
- Any bulk change where the updated information is unique to each item changed.

Some of the benefits of SASI Loader include:

- SASI Loader allows your employees to spend more of their time managing the network, and less of their time managing the database.
- SASI Loader can run unattended at night or while Granite users are working on other business.
- SASI Loader provides detailed reports of what was loaded, which changes were made and what records require correction and reprocessing. Records that require further attention are automatically parsed into a new load file, for easy correction and processing.
- SASI Loader increases the speed at which important database changes are made, thus minimizing or avoiding change control issues, enhancing the value of your Granite inventory data and maximizing your return on investment.
- SASI Loader reduces your reliance on expensive contractors to manually input data, and eliminates typing errors.

Most importantly, SASI Loader allows you to finally use your Granite Inventory system the way you want to. Too often Granite customers continue to suffer from inconsistent naming standards, outdated equipment and path models, and a data set that just isn't as up-to-date as they need. When it's difficult, time-consuming and expensive to update your database, you tend to focus on only the essentials and to "make do" with the models you have, instead of taking advantage of the new features available in later versions of Granite.

With SASI Loader, you can quickly and inexpensively make the mass updates to your system that are needed to implement your vision of what Granite should include and how it should work, without incurring prohibitive costs. Here's what some current users of SASI Loader have to say about the product:

"SASI Loader completely changed the way I work in Granite and made me much more efficient"

**Network Engineer
Major U.S Cable Company**

"I must say, I am impressed.... It would typically take 2 to 3 weeks to load the (990) trunk T1s for a new switch. SASI Loader completed the work in 10 hours."

**Manager of Traffic & Design
Major U.S Mobile Carrier**
